Preservation Power of Honey

Name _____

Food Preservation Methods

How do people prevent the following foods from spoiling?

	My Prediction	Post Class Discussion
Beef jerky		
Bread		
Milk		
Pickles		
Raw steak		
Cucumber		
Cup cake		
Croutons		
Twinkie		

Part 1: Measuring Antibacterial Properties of Honey

Honey bee societies like human societies have to manage logistics such as adequate space, shelter, and a safe, year-round food supply. Bees rely on plants that flower during summer months to provide nectar, a carbohydrate and pollen, a protein source to last throughout the year. Bees need to safely store their food for times when flowering plants are not available.

Listen to the audio clip: Why Honey Doesn't Spoil? (2:30)
http://indianapublicmedia.org/amomentofscience/honey-spoil/

1. Do bees use any of the same methods to preserve their food supply? If so, which ones?

_____

_____

_____

_____

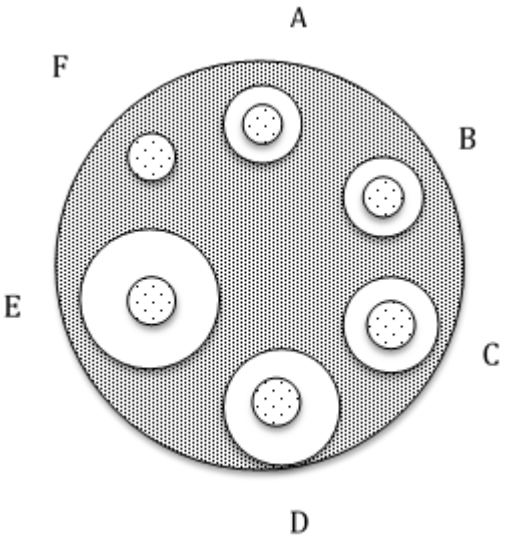
Preservation Power of Honey (continued)

Researchers interested in the use of honey as an antibacterial set up the following experiment.

1. Bacteria commonly found in milk was evenly applied to growth medium in a petri dish.
2. Five concentrations of honey (5, 10, 15, 20, and 25%) and water (as a control) were applied to antibacterial discs.
3. All six (6) discs were placed in the petri dish and labelled with letters A-F.
4. The petri dish was incubated at 36°C for 24 hours to allow bacteria to grow.

Using a ruler, measure the zone of inhibition for each disc and record in the data table.

Disc	Concentration (mg/ml) of honey used	Diameter (mm) of zone of inhibition
A	5	
B	10	
C	15	
D	20	
E	25	
F	Water only	



2. What is the relationship between the concentration of honey and the size of the zone of inhibition caused by the honey?

_____

_____

3. Suggest a reason for this relationship.

_____

_____

_____

Listen to the audio clip: Honey: Food for Yeast or a Natural Preservative? (2:02)
http://indianapublicmedia.org/amomentofscience/honey-food-yeast-natural-preservative/

4. Honey is more expensive than sugar, $2.00 per pound versus $ 0.34 per pound. Do you think a concentrated sugar solution could be used as a more cost effective antibacterial preservative?

_____

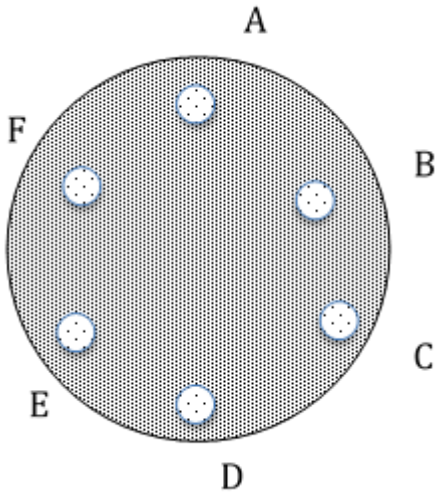
_____

Preservation Power of Honey (continued)

Part 2: Comparing Sugar to Honey

The researchers were encouraged by their finding about the antibacterial property of honey in Part 1 and decided to test if the same concentrations of sugar rather than honey could similarly inhibit the growth of bacteria commonly found in milk. The same experimental set up was used from part 1, except the discs were treated with various concentrations of sugar (fructose) rather than honey.

Disc	Concentration (mg/ml) of sugar used	Diameter (mm) of zone of inhibition
A	5	
B	10	
C	15	
D	20	
E	25	
F	Water only	



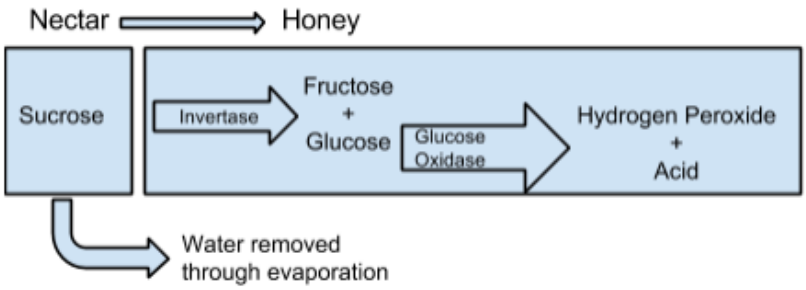
5. Compare the fructose data to the honey data. Do you agree that sugar would be a more cost effective alternative for food preservation? Explain.

_____

_____

Is honey "just" a concentrated sugar solution? Do bees add anything special to the mix? To answer these questions, we will need to understand how honey is made.

Bees need a source of sugar for energy. Some plants attract bees by providing the sugar in the form of nectar. During the course of collecting the nectar, bees transfer pollen from plant to plant. The foraging bees carry the nectar back to the hive. Upon returning to the hive, the forager unloads the nectar to a receiver bee. The receiver bee modifies the nectar by repeatedly using her tongue to expose the nectar to air which decreases the water content. During this process, two important enzymes are added. The enzyme *invertase* is responsible for breaking down sucrose, a disaccharide into its component monosaccharides glucose and fructose. The second important enzyme is glucose oxidase which breaks down some of the glucose into hydrogen peroxide (H_2O_2) and acid.



6. Examine the diagram of honey. Which parts of the honey do you think inhibit the growth of bacteria?

_____

_____

Part 3: Can honey inhibit the growth of bacteria in food products?

Milk and dairy products are an important part of a healthy diet providing an inexpensive source of protein, vitamins, and minerals. Spoilage of milk is a major limitation in providing this valuable food source to people who do not have access to refrigeration. Can the preservation power of honey prevent spoilage in milk?

To test this hypothesis, researchers tested samples of milk divided into two groups, milk with honey added and milk without honey. After six days, milk was tested for bacterial content using turbidity.

Turbidity is the measure of relative clarity of a liquid and can be used as an indicator of bacterial content. Presence of bacteria increases the cloudiness and therefore turbidity of the milk.

Image source: http://water.usgs.gov/edu/turbidity.html

7. What is the relationship between cloudiness and the turbidity value of the vials in the image?

_____

_____

Use the data in the table to calculate the percent inhibition of growth.

No. of days of storage	Turbidity of milk **with** honey	Turbidity of milk **without** honey	Percent difference in inhibition of growth $\frac{\lvert with\ honey - without\ honey \rvert}{\frac{with\ honey + without\ honey}{2}}\ x\ 100\%$
0	0.62	0.75	$\frac{\lvert 0.62-0.75 \rvert}{\frac{0.62+0.75}{2}} = \frac{0.13}{0.685} = 0.189$ x 100% = 18.9%
3	0.78	1.41	
4	0.82	1.56	
5	0.89	1.73	
6	0.94	1.84	

8. Is honey an effective preservative for milk? Explain.

_____

_____

9. One quarter of the world's population does not have access to electricity. Without refrigeration, it can be difficult or impossible for people to gain access to a consistent or safe supply of milk. Do you believe adding honey to milk as a preservative is a feasible solution to this challenge? Why or why not?
